

Project Design Phase-II
Project Design Phase

Date	12 March 2025
Team ID	PNT2025TMID02665
Project Name	Power BI Inflation Analysis: Journeying Through Global Economic Terrain
Maximum Marks	4 Marks

PROBLEM SOLUTION FIT

Problem Solution Fit:-

The global economy is characterized by constant fluctuations in inflation, which have profound implications for businesses, governments, and consumers. Inflation can affect everything from purchasing power to pricing strategies, policy decisions, and economic stability. As inflation trends vary by region and sector, it becomes critical for decision-makers to have access to accurate, real-time, and insightful data to navigate the complexities of the global economic terrain.

This project aims to design a solution that leverages Power BI to provide a comprehensive analysis of inflation trends, offering key insights for understanding and mitigating inflationary pressures across the globe. By exploring inflation data visually, this project ensures that stakeholders can easily analyze and interpret inflation trends in relation to economic factors, commodities, and regional performance.

Problem Statement:

Inflation is a complex, multifaceted issue that varies greatly by region, sector, and time. Traditional methods of analyzing inflation often involve static reports and isolated data points that fail to capture the full picture of global economic dynamics. This presents several key challenges:

- **Lack of Interactivity:** Existing tools often provide static reports or overly complex data analysis, which limits the ability to explore inflation data across different dimensions.
- **Fragmented Data Sources:** Inflation data is scattered across different sources and formats, making it difficult to integrate and analyze holistically.
- **Delayed Insights:** Traditional inflation reports are often published on a monthly or quarterly basis, making real-time decision-making difficult.
- **Difficulty in Scenario Analysis:** Policymakers and businesses often lack tools to simulate the effects of changes in economic variables (such as interest rates or commodity prices) on inflation in real-time.
